Abstract. An efficient one-pot synthesis of benzimidazole derivatives by the condensation between various *o*-phenylenediamine and substituted aromatic aldehyde using $ZnFe_2O_4$ as a nano-catalyst under ultrasonic irradiation conditions was described. Remarkable advantages of the present synthetic strategy over the others are shorter reaction times, higher isolated yields and simple work-up procedure. The presence of electron withdrawing and electron donating groups on the aromatic rings did not affect the yield of the product. $ZnFe_2O_4$ as a nano-catalyst easily recovered after completion of the reaction and was reused.
